

Soft-tissue case 47. Presentation

A 51-year-old man presented with a lower abdominal mass and dull, aching pain for 6 months. The onset of the pain was insidious. On examination a mass arising from the pelvis was palpable in the suprapubic region and on digital rectal examination. Further investigation included

ultrasonography and magnetic resonance imaging. Fig. 1 is a representative coronal view MR image of the abdomen.

What is your diagnosis?

For the answer and a discussion see page 391.
