

CONCLUSIONS

Based on the U of T model of future Ontario urologist supply and need for urologist services, there will be a significant shortage of urologists for the foreseeable future. The model makes use of the best data on urology resource allocation currently available and relies on a set of clearly defined and reasonable assumptions regarding the future. The methodology of the U of T model is generalizable and can be applied to work-force projections for other physician groups in Ontario and the rest of Canada. This form of modelling is vital in planning how scarce resources should be allocated today for the future and should be used by federal and provincial authorities in conjunction with all stakeholders in health care allocation management to create a rational and comprehensive strategy for the future.

We acknowledge the generous assistance of the following, without whom this project could not have been completed: Kathleen Clements at the Ontario Physician Human Resources Data Centre, Danielle Frechette at the Royal College of Physicians and Surgeons of Canada, A. Dianne Thurber of the Canadian Post-MD Education Registry and Dr. Jim Wilson from Queen's University, Kingston. We

particularly appreciated the support and inspiration of University of Toronto Dean of Post-graduate Medicine Dr. J. L. Provan, who died in July 1996.
