

Soft-tissue case 46. Presentation

A 14-year-old boy presented with a 3-month history of left upper quadrant abdominal pain and fever. There was no history of nausea, vomiting or change of bowel habit or of abdominal trauma.

On examination, a mass was pal-

pable in the left upper quadrant. The boy's abdomen was soft and non-tender. Bowel sounds were present. Laboratory investigations showed eosinophilia. The findings on chest radiography were normal. The boy

underwent abdominal ultrasonogra-
phy (Fig. 1) and computed tomogra-
phy (Fig. 2).

What is the diagnosis?

For the answer and a discussion
see page 308.
